# R-code for 'GCalignR: An R package for aligning Gas-Chromatography data'

Meinolf Ottensmann, Martin A. Stoffel, Joseph I. Hoffman

This document provides all the R code used for our manuscript. Both the Rmarkdown file and the data can be accessed directly by downloading this GitHub repository. Just click on the link and then download a zip archive containing all the files. Make sure you read the instructions the README file on GitHub. For computational reasons we provide the results of time consuming steps along as separate datasets. If you have any questions, do not hesitate to contact: meinolf.ottensmann@web.de

## Prerequisites

Most functions that are used in this analysis are part of our package GCalignR, while some more functions are provided in form of R scripts that are available in the sub-directory R. In order to run the code you need to have a sub-directory called data that contains the raw datafiles.

• Install devtools, ggplot2, plot3D and vegan if these packages are not available.

```
## install devtools
if (!("devtools" %in% rownames(installed.packages()))) {
    install.packages("devtools")
} else if (packageVersion("devtools") < 1.6) {</pre>
    install.packages("devtools")
}
## install ggplot2
if (!"ggplot2" %in% rownames(install.packages())) {
    install.packages("ggplot2")
## install plot3D
if (!"plot3D" %in% rownames(installed.packages())) {
    install.packages("plot3D")
}
## install vegan
if (!"vegan" %in% rownames(installed.packages())) {
    install.packages("vegan")
}
```

• Installing the most recent version of GCalignR from GitHub.

```
## install GCalignR
devtools::install_github("mastoffel/GCalignR")
```

• Load packages and source custom functions.

```
library(GCalignR)
library(plot3D)
library(vegan)
## small function to test parameters in
## align_chromatograms
source("R/optimal_params.R")
## calculates errors by matching aligned data to a
```

```
## table of known substances
source("R/error_rate.R")
## custom function for simulations based on
## chromatograms
source("R/ChromaSimFunctions.R")
```

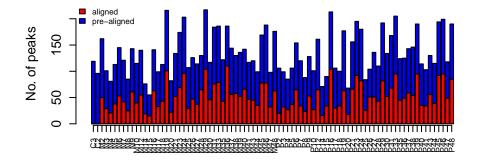

## Workflow of GCalignR

In order to begin the alignment procedure, the following code needs to be executed:

```
aligned_peak_data <- align_chromatograms(data = peak_data,
    rt_col_name = "time", max_diff_peak2mean = 0.02,
    min_diff_peak2peak = 0.08, max_linear_shift = 0.05,
    delete_single_peak = TRUE, blanks = c("C2", "C3"))</pre>
```

Afterwards, a summary of the alignment process can be retrieved using the printing method, which summarises the function call including defaults that were not altered by the user. This provides all of the relevant information to retrace every step of the alignment procedure.

```
print(aligned_peak_data) # verbal summary of the alignment procedure
#> Summary of Peak Alignment running align_chromatograms
#> Input: peak_data
#> Start: 2017-02-01 18:04:11 Finished: 2017-02-01 18:41:11
#>
#> Call:
#>
     GCalignR::align\_chromatograms(data=peak\_data, rt\_col\_name=time,
#>
    max\_linear\_shift=0.05, blanks=(C2, C3), sep=\t, rt\_cutoff\_low=NULL,
    rt_cutoff_high=NULL, reference=NULL, max_diff_peak2mean=0.02,
#>
#>
   min_diff_peak2peak=0.08, delete_single_peak=FALSE)
#>
#> Summary of scored substances:
#>
      total blanks retained
       490
#>
                171
                         319
#>
#> In total 490 substances were identified among all samples. 171 substances were
   present in blanks. The corresponding peaks as well as the blanks were removed
#>
    from the data. 319 substances are retained after all filtering steps.
#>
#> Sample overview:
    The following 84 samples were aligned to the reference 'P31':
#>
    M2, M3, M4, M5, M6, M7, M8, M9, M10, M12, M14, M15, M16, M17, M18, M19, M20,
#>
#>
    M21, M23, M24, M25, M26, M27, M28, M29, M30, M31, M33, M35, M36, M37, M38, M39,
   M40, M41, M43, M44, M45, M46, M47, M48, P2, P3, P4, P5, P6, P7, P8, P9, P10,
#>
   P12, P14, P15, P16, P17, P18, P19, P20, P21, P23, P24, P25, P26, P27, P28, P29,
#>
   P30, P31, P33, P35, P36, P37, P38, P39, P40, P41, P43, P44, P45, P46, P47, P48
#>
#> For further details type...
```

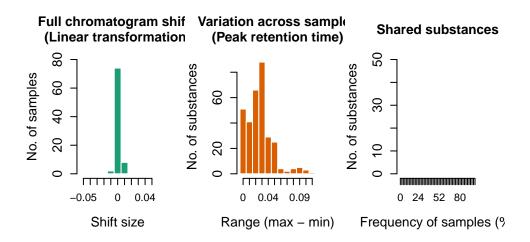

Figure 1: Diagnostic plots summarise aligned datasets

```
#> 'gc_heatmap(aligned_peak_data)' to retrieve heatmaps
#> 'plot(aligned_peak_data)' to retrieve further diagnostic plots
```

As alignment quality may vary with the parameter values selected by the user, the plot function can be used to output four diagnostic plots. These allow the user to explore how the parameter values affect the resulting alignment and can help flag issues with the raw data.

```
plot(aligned_peak_data) # Figure 1
```

Additionally, the full alignment can be visualised inspected using a heat map with the function gc\_heatmap.

gc\_heatmap(aligned\_peak\_data, type = "binary", threshold = 0.05) # Figure 2

#### Peak normalisation

In order to account for differences in the total concentration of samples, we provide an additional function normalise\_peaks that can be used to normalise peak abundances.

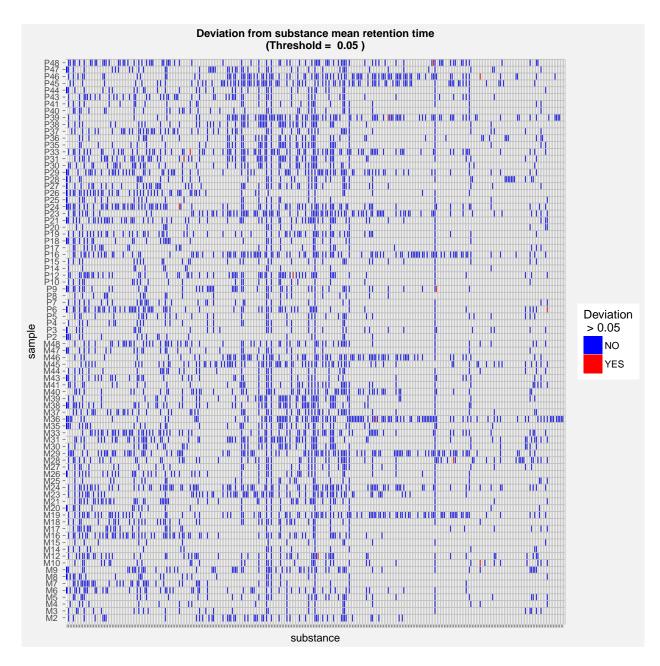

Figure 2: Heatmaps allow to inspect the distribution of substances across samples as well as the variability of their retention times.

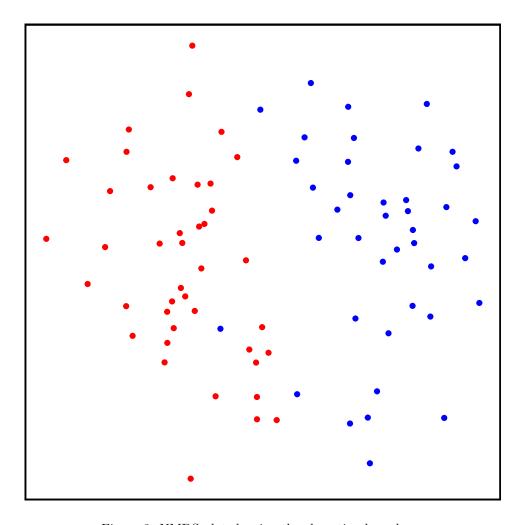

Figure 3: NMDS plot showing the cluserting by colony

#### Downstream analyses

The output of GCalignR is compatible with other functionalities in R, thereby providing a seamless transition between packages. For instance, multivariate analyses can be conduced using the package vegan (Oksanen et al. 2016). To visualise patterns of chemical similarity within the fur seal dataset in relation to breeding colony membership, we implemented non-metric-multidimensional scaling (NMDS) based on a Bray-Curtis dissimilarity matrix and visualised the outcome using ggplot2 (Wickham 2009).

### Explore the parameter space in align\_chromatograms

There are two parameters of major importance, namely max\_diff\_peak2mean and min\_diff\_peak2peak. While the first determines the finescale grouping of retention times the latter greatly influences the formation of substances by combining initially separated rows of similar retention times. Here, we evaluate the error rate as a function of the combination of these two parameters. The combinations are tested by iteratively running aling\_chromatograms 100 parameter combinations.

• Run alignments with all combinations of both parameters

```
## B. flavifrons
results_bfla <- optimal_params(data = "data/bfla.txt",</pre>
   rt_col_name = "RT", max_diff_peak2mean = seq(from = 0.01,
        to = 0.05, by = 0.01), min_diff_peak2peak = seq(from = 0.01),
        to = 0.2, by = 0.01)
save(results_bfla, file = "data/results_bfla.RData")
## B. bimaculatus
results_bbim <- optimal_params(data = "data/bbim.txt",
   rt_col_name = "RT", max_diff_peak2mean = seq(from = 0.01,
        to = 0.05, by = 0.01), min diff peak2peak = seq(from = 0.01),
        to = 0.2, by = 0.01)
save(results_bbim, file = "data/results_bbim.RData")
## B. ephippiatus
results_beph <- optimal_params(data = "data/beph.txt",
   rt_col_name = "RT", max_diff_peak2mean = seq(from = 0.01,
        to = 0.05, by = 0.01), min_diff_peak2peak = seq(from = 0.01),
        to = 0.2, by = 0.01)
save(results_beph, file = "data/results_beph.RData")
```

• Estimate error rates

Error rate calculations are executed with a custom function error\_rate that uses a list of annotated substances as a reference. See the code for details.

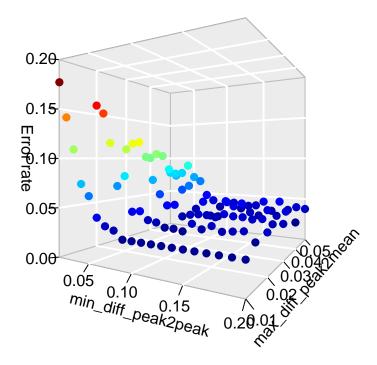

Figure 4: Parameter combinations B. bimaculatus dataset

```
errors_bfla[["error"]] <- unlist(lapply(X = results_bfla[[1]],
    error_rate, "data/bfla_ms.txt"))</pre>
```

• Plot results using package plot3D

```
with(errors_bbim, scatter3D(x = p2p, y = p2m, z = error,
    pch = 19, size = 2, theta = 30, phi = 0, ticktype = "detailed",
    main = "", xlab = "min_diff_peak2peak", ylab = "max_diff_peak2mean",
    zlab = "Error rate", bty = "g", colkey = FALSE,
    cex = 1, cex.lab = 1, cex.axis = 1, cex.main = 1.5,
    zlim = c(0, 0.2)))

with(errors_beph, scatter3D(x = p2p, y = p2m, z = error,
    pch = 19, size = 2, theta = 30, phi = 0, ticktype = "detailed",
    main = "", xlab = "min_diff_peak2peak", ylab = "max_diff_peak2mean",
    zlab = "Error rate", bty = "g", colkey = FALSE,
    cex = 1, cex.lab = 1, cex.axis = 1, cex.main = 1.5,
    zlim = c(0, 0.2)))

with(errors_bfla, scatter3D(x = p2p, y = p2m, z = error,
    pch = 19, size = 2, theta = 30, phi = 0, ticktype = "detailed",
```

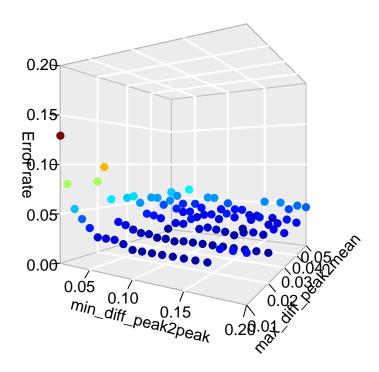

Figure 5: Parameter combinations B. ephippiatus dataset

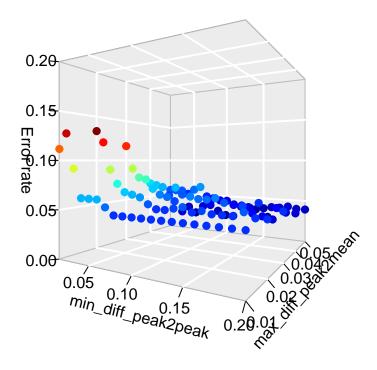

Figure 6: Parameter combinations B. flavifrons dataset

```
main = "", xlab = "min_diff_peak2peak", ylab = "max_diff_peak2mean",
zlab = "Error rate", bty = "g", colkey = FALSE,
cex = 1, cex.lab = 1, cex.axis = 1, cex.main = 1.5,
zlim = c(0, 0.2)))
```

# Influence of additional random noise on the detection of patterns in the fur seal dataset

• The input data for this simulation is the raw chemical dataset that is available within aligned\_peak\_data.RData. This file is supplied with the package.

```
## list of samples

```

# Validation based on error rates of known substances from three bumblebee datasets

To further assess the performance of GCalignR, we calculated alignment error rates based on three previously published bumblebee dataset comprising known substances identified using GC-MS (Dellicour & Lecocq 2013). The first dataset comprises 24 Bombus bimaculatus individuals characterised for 32 substances (total = 717 retention times). The second comprises 20 B. ephippiatus individuals characterised for 42 substances (total = 782 retention times) and the third comprises 11 B. flavifrons individuals characterised for 44 substances (total = 457 retention times). We calculated the error rate as the ratio between incorrectly assigned retention times and the total number of retention times (equation (1)).

$$rt_{m} > \left(\frac{\sum_{i=1}^{m-1} rt_{i}}{m-1}\right) + \max\_diff\_peak2mean$$
 (1)

By systematically changing the two parameters max\_diff\_peak2mean and min\_diff\_peak2peak, we explored 100 parameter combinations to explore how parameter values affect the alignment accuracy.

• We align that untreated dataset in order to extract input retention times

```
bbim_zero <- align_chromatograms(data = "data/bbim.txt",
    rt_col_name = "RT")</pre>
```

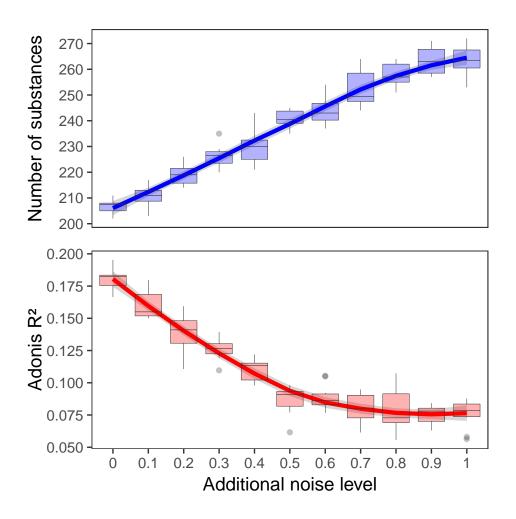

Figure 7: Effects of additional noise on alignments of the fur seal data

```
• Prepare the data for simulations
